

POWER BI PROJECT

1. Firstly, I should mention that this project was created based on “Alex The Analyst” courses. The data used here coming from real-life survey regarding Data Analytics jobs among hundreds of different people. Planned to be cleaned only using Power BI.
2. There is a lot of data that need cleaning, from what I see. Several columns can be deleted as well.

The screenshot shows a Power BI data table with columns: Unique ID, Email, Date Taken (America/New_York), Time Taken (America/New_York), and Time Spent. The filter pane on the right shows filters for Browser, OS, City, Country, and Referrer. The 'City' filter is expanded, showing a search bar and a list of cities with checkboxes for '(Select All)', '(blank)', and various city names.

3. Column named “Which title best fits your role?” has a lot of positions with different job titles, but it’s gonna be cleaned now – cleaning just the job titles from “Other (Please specify):” text, by using delimiter, replacing values and Trim function to delete start spaces.

The screenshot shows the filter pane for the 'Which title best fits your role?' column. It includes a search bar and a list of job titles with checkboxes: (Select All), Data Analyst, Data Architect, Data Engineer, Data Scientist, Database Developer, Other, and Student/Looking/None. The 'Other' checkbox is checked.

4. Cleaning the salary ranges to be more usable. Creating clone column. Splitting by Digit to non-digit. Replacing the useless signs and letters. Adding and dividing SUM by 2 to find the average salary for each range in Custom column.

The screenshot shows the custom column formula editor for 'Q3 - Current Yearly Salary (in USD)'. The formula is: $\sim ([\text{Q3} - \text{Current Yearly Salary (in USD).1}] + [\text{Q3} - \text{Current Yearly Salary (in USD).2}]) / 2$. The filter pane on the right shows filters for 'Q3 - Current Yearly Salary (in USD)' with a search bar and a list of salary ranges with checkboxes: (Select All), 105, 125, 150, 225, 40, 65, and 85.

5. There was a question about mostly used programming language, but there were also ETLs. So I decided to combine them to one separate category, but all the others keep as **Other**. I replaced the values as A, B, C with “ ” accordingly and then placed under one naming.

The screenshot shows the filter pane for the 'Programming Language' column. It includes a search bar and a list of programming languages with checkboxes: (Select All), C/C++, Java, JavaScript, Other, Python, R, and SQL/Excel/VBA. The 'Other' checkbox is checked.

6. Some other columns as well.

6.1. At some point my project crashed and I had to start doing it all over again. But at this moment I wanted to add even more editing here. For example, to the question **Q8** about the reasons why would person change the job, based on answers under Other category, I saw some repeatings that were similar to themselves. So I decided to use **Power Query** in new column and use **IF** statement wit **OR** and **Text.Contains** which worked just fine!

Add a column that is computed from the other columns.
New column name
Custom
Custom column formula

```
= if Text.Contains([#"Q8 - If you were to look for a new job today, what would be the most important thing to you?"], "learning", Comparer.OrdinalIgnoreCase) or Text.Contains([#"Q8 - If you were to look for a new job today, what would be the most important thing to you?"], "Opportunity", Comparer.OrdinalIgnoreCase) or Text.Contains([#"Q8 - If you were to look for a new job today, what would be the most important thing to you?"], "opportunities", Comparer.OrdinalIgnoreCase) then "Learning new abilities" else [#"Q8 - If you were to look for a new job today, what
```

Available columns
Q0 - How happy are you in
Q6 - How Happy are you in
Q6 - How Happy are you in
Q7 - How difficult was it for
Q8 - If you were to look for
Q9 - Male/Female?
Q10 - Current Age
Q11 - Which Country do you
<< Insert
No syntax errors have been detected.
OK

6.2. Decided to make **Current Age** column more usable. Power Query that works on IF ELSE statement.

New column name
Custom
Custom column formula

```
= if [#"Q10 - Current Age"] < 20 then "Youth (to 20)" else if [#"Q10 - Current Age"] < 45 then "Young Adulthood (20-44)" else if [#"Q10 - Current Age"] < 65 then "Middle Adulthood (45-64)" else "Elderly (65+)"
```

Q0 - How happy are
Q6 - How Happy are
Q7 - How difficult w
Q8 - If you were to k
Q9 - Male/Female?
Q10 - Current Age
Q11 - Which Countr

7. I can start now with visualization. The title. Visual of **Avg Salary** per Job title. People's favourite programming languages.

7.1. Average Age & Total Survey Takers. A Map of where the respondents are from.

8. I added several more visualizations here – and that’s how the final Dashboard looks like!
